Who are we?

Simon Wörpel

- Director of Technology, DARC

Alex Ștefănescu

- Senior Developer, DARC

How to reveal metadata and other hidden information in PDF documents

Should I open this PDF?

Two options:

- OpenAleph
 - also enables search, cross-referencing
- dangerzone.rocks
 - transforms PDF into a series of images (no code, no surprises when clicking links)

Metadata

Command line: **exiftool**

- Author, e-mail, timestamps, software
- **exiftool file.pdf**

Remove Metadata

Metadata can be edited with **exiftool**, but **all edits are reversible**.

This includes [removing metadata](#).

```
exiftool -all= some.pdf
```

```
qpdf --linearize some.pdf done.pdf
```

Experiment: remove redactions

```
qpdf --qdf --object-streams=disable initial.pdf  
result.pdf
```

The PDF should now be “readable” in a text editor.

Attempt to remove the black “redaction” boxes by deleting lines that look like coordinates for a drawn rectangle. Consult the resulting PDF file in your

AI-powered search through audio and video

Why tell when you can show?

Our goal will be to:

- Upload audio files to OpenAleph
- Find all files that mention a name
- Read the transcripts of the files

Why tell when you can show?

1. Upload audio to OpenAleph
2. Transcribe it locally
3. Get FTM entities from the Postgres database
4. Get the FTM entities from OpenAleph
5. Add the transcription to the entities
6. Push the new entities to OpenAleph
